FOR IMMEDIATE RELEASE

Attention Editor

LED TS300 FIXTURE RELEASED: Low power, long-life LEDs allow for cost- saving operation and three-step dimming.

Dec. 14, 2010 - Sacramento, CA – High intensity, long-life LEDs make Traffic Safety Corporation's (TSC) TS300 under vehicle inspection light more cost-effective than ever.

The new design incorporates high intensity, long-life LEDs with output comparable to halogen products for minimal maintenance and operation costs. 50,000 hour LEDs provide a lamp life 25 times longer than halogen to improve the existing low-maintenance fixture.

Highly efficient LED lamps use 94% less energy than halogen, affording significant savings on energy.

The new LED TS300 fixture has a dimming capability with three brightness levels to provide 100%, 50% and 25% intensity output. The new TS3000 Controller has the power to drive the most demanding applications, with a standard 150 watt power supply and a 300 watt version available for large truck inspections.

This advancement allows for more affordable safety inspections at military bases, weigh stations, check points and other controlled-access facilities.
